GASTROESOPHAGEAL REFLUX DISEASE (GERD)

A little knowledge can make a big difference.
Gastroesophageal reflux disease, or GERD, is very common, affecting up to 1 in 5 or more of adult men and women in the U.S. population. It also occurs in children. Although common, the disease often is unrecognized – its symptoms misunderstood. This is unfortunate because GERD is generally a treatable disease, though serious complications can result if it is not treated properly.

The purpose of this publication is to advance understanding of the nature of GERD, how to recognize the disorder, and how to treat it. Heartburn is the most frequent – but not the only – symptom of GERD. (The disease may be present even without apparent symptoms.) Heartburn is not specific to GERD and can result from other disorders that occur inside and outside the esophagus. All too often, GERD is either self-treated or mistreated.

GERD is a chronic disease. Treatment usually must be maintained on a long-term basis, even after symptoms have been brought under control. Issues of daily living and compliance with long-term use of medication need to be addressed as well. This can be accomplished through follow-up and education.

GERD is often characterized by painful symptoms that can undermine an individual’s quality of life. Various methods to effectively treat GERD range from lifestyle measures to the use of medication or surgical procedures. It is essential for individuals who suffer the chronic and recurrent symptoms of GERD to seek an accurate diagnosis, to work with their physician, and to receive the most effective treatment available.

WHAT IS GERD?

Gastroesophageal reflux disease, or GERD, is a very common disorder. Gastroesophageal refers to the stomach and the esophagus. Reflux refers to the back-flow of acidic or non-acidic stomach contents into the esophagus. GERD is characterized by symptoms, with or without tissue damage, that result from repeated or prolonged exposure of the lining of the esophagus to acidic or non-acidic contents from the stomach. If tissue damage is present, the individual is said to have esophagitis or erosive GERD. The presence of symptoms with no evident tissue damage is referred to as non-erosive GERD.

GERD is often accompanied by symptoms such as heartburn and regurgitation of acid. But sometimes there are no apparent symptoms, and the presence of GERD is revealed only when complications become evident.

WHAT CAUSES REFUX?

After swallowed food travels down the esophagus, it stimulates cells in the stomach to produce acid and pepsin (an enzyme), which aid digestion. A band of muscle at the lower part of the esophagus, called the lower esophageal sphincter (LES), acts as a barrier to prevent the back-flow (reflux) of stomach contents into the esophagus. The LES normally relaxes to allow swallowed food to pass into the stomach. Reflux occurs when that barrier is relaxed at inappropriate times, is weak, or is otherwise compromised. Factors like distention of the stomach, delayed emptying of the stomach, large sliding hiatal hernia, or too much acid in the stomach can also make it easier for acid reflux to occur.
**WHAT CAUSES GERD?**

There is no known single cause of GERD. It occurs when the esophageal defenses are overwhelmed by gastric contents that reflux into the esophagus. This can cause injury to tissue. GERD can also be present without esophageal damage (approximately 50–70% of patients have this form of the disease).

Gastroesophageal reflux occurs when the LES barrier is somehow compromised. Occasional reflux occurs normally, and without consequence other than infrequent heartburn, in people who do not have GERD. In people with GERD, reflux causes frequent symptoms or damages the esophageal tissue.

Some, but not all, people with hiatal hernia have GERD and vice versa. Hiatal hernia occurs when a part of the stomach moves above the diaphragm, from the abdominal to the chest area. The diaphragm is a muscle that separates the chest (containing the esophagus) from the abdomen (containing the stomach). If the diaphragm is not intact, it can compromise the ability of the LES to prevent acid reflux. A hiatal hernia may decrease the sphincter pressure necessary to maintain the anti-reflux barrier.

Even when the LES and the diaphragm are intact and functioning normally, reflux can still occur. The LES may relax after having large meals leading to distension of the upper part of the stomach. When that happens there is not enough pressure at the LES to prevent reflux. In some patients the LES is too weak or cannot mount enough pressure to prevent reflux during periods of increased pressure within the abdomen.

The extent of injury to the esophagus — and the degree of severity of GERD — depends on the frequency of reflux, the amount of time the refluxed material stays in the esophagus, and the quantity of acid in the esophagus.

**WHAT ARE THE COMMON SYMPTOMS OF GERD?**

Symptoms of GERD vary from person to person. The majority of people with GERD have mild symptoms, with no visible evidence of tissue damage and little risk of developing complications. Chronic heartburn is the most frequently reported symptom of GERD. Acid regurgitation (refluxed acid into the mouth) is another common symptom, sometimes associated with sour or bitter taste.
CAN SYMPTOMS OTHER THAN HEARTBURN BE SIGNS OF GERD?

Numerous symptoms other than heartburn are associated with GERD. These may include belching, difficulty or pain when swallowing, or waterbrash (sudden excess of saliva). An alarming symptom needing prompt medical attention is dysphagia (the sensation of food sticking in the esophagus). Other GERD symptoms may involve chronic sore throat, laryngitis, throat clearing, chronic cough, and other oral complaints such as inflammation of the gums and erosion of the enamel of the teeth. Small amounts of acid can reflux into the back of the throat or into the lungs and cause irritation. Hoarseness in the morning, a sour taste, or bad breath may be clues of GERD. Chronic asthma, cough, wheezing, and noncardiac chest pain, (it may feel like angina) may be due to GERD. People with these symptoms often have less frequent or even absent typical symptoms of GERD such as heartburn.

Chest pain or chest pressure may indicate acid reflux. Nevertheless, this kind of pain or discomfort should prompt urgent medical evaluation. Possible heart conditions must always be excluded first.

When seeing a doctor, relief or improvement of symptoms after a two-week trial therapy with a proton pump inhibitor (a prescription medication that inhibits gastric acid secretion) is an indication that GERD is the likely cause. This can also be confirmed with pH monitoring, which measures the level of acid refluxing into the esophagus and as high as the larynx.

WHAT IS HEARTBURN?

Most people describe heartburn as a burning sensation in the center of the chest behind the breast bone. It may radiate upward toward the throat. Heartburn is usually caused by acid reflux in the esophagus. The lining of the esophagus is much more sensitive to acid than the stomach, which is why the burning sensation is felt. In people with GERD, persistent heartburn can be painful, can disrupt daily activities, and can awaken a person at night.

IS HEARTBURN DANGEROUS?

Heartburn is a symptom. It is very common; it is estimated that over 44% of adult Americans have heartburn at least once a month. Nevertheless, if heartburn occurs on a regular basis, the acid that causes heartburn has the potential to injure the lining of the esophagus. It can cause ulceration, which may cause discomfort or even bleeding. Stricture (narrowing of the esophagus caused by acid, which leads to scar formation) can also result from chronic and frequent acidic reflux. People with stricture have difficulty swallowing food.

Severity, frequency, or intensity of symptoms cannot distinguish between patients with or without erosive GERD. However, heartburn that occurs more frequently than once a week, becomes more severe, or occurs at night and wakes a person from sleep, may be a sign of a more serious condition and consultation with a physician is advised. Atypical symptoms such as hoarseness, wheezing, chronic cough or non-cardiac chest pain may also need to be evaluated by a physician for GERD as a cause. Even occasional heartburn — if it has occurred for
a period of five years or more, or is associated with
dysphagia – may signal an association with a more
serious condition. People with long-standing chronic
heartburn are at a greater risk for complications
including stricture or a potentially pre-cancerous
disease that involves a cellular change in the
esophagus called Barrett’s esophagus.

WHEN ARE OVER-THE-COUNTER
PREPARATIONS APPROPRIATE TO
TREAT HEARTBURN?

Multiple preparations are available without a
prescription to treat occasional heartburn. These
include: antacids, which neutralize acid (e.g.,
sodium bicarbonate, calcium carbonate, aluminum
hydroxide, magnesium hydroxide); alginic acids
(e.g., Gaviscon, Foamicon), which form a foam
barrier to reflux; and low-dose H2 blockers (e.g.,
Pepcid, Tagamet, Zantac, Axid), which reduce acid
production – and are available in higher doses by
prescription to treat GERD. These medications are
useful to relieve intermittent heartburn, particularly if
brought on occasionally by foods or various activities.
Antacids and alginic acids give the most rapid relief.
The H2 blockers give more sustained relief and are
most useful if taken prior to an activity known to
bring on heartburn, like eating spicy foods. Prilosec
OTC, Zegerid OTC, and Prevacid 24HR are proton
pump inhibitors (PPIs) now available over-the-
counter. These are far more powerful than the other
medications mentioned above. They are recommended
to be taken daily for 14 days. They are not intended to
be taken on an as needed basis. If the symptoms are
not improved or if they recur after stopping the PPI,
one should see a doctor.

Over-the-counter preparations provide only
temporary symptom relief. They do not prevent
recurrence of symptoms or allow an injured
esophagus to heal. They should not be taken
regularly as a substitute for prescription medicines –
they may be hiding a more serious condition. If
needed regularly, for more than two weeks, consult a
physician for a diagnosis and appropriate treatment.

HOW IS GERD DIAGNOSED?

A diagnosis of GERD should be made by a doctor.
The disease can usually be diagnosed based on the
presentation of symptoms alone. GERD can occur,
however, with atypical symptoms or even no apparent
symptoms. Diagnostic tests may be used to confirm
or exclude a GERD diagnosis or to look for atypical
symptoms or even no apparent symptoms. Tests also
may be used to confirm or exclude GERD-related
complications such as inflammation, stricture, or
Barrett’s esophagus.

WHAT TESTS ARE USED
to DIAGNOSE GERD?

Diagnostic tests are used to confirm or exclude
GERD or as part of a pre-surgical evaluation. One
method is a therapeutic trial with a proton pump
inhibitor, or PPI, a medication used to treat GERD.
Studies have shown that symptomatic relief after
two weeks of treatment with a PPI correlates with a
diagnosis of GERD. Other tests include:

- Endoscopy
- Esophageal manometry
- Esophageal pH monitoring
- Esophageal impedance + pH
**Endoscopy** is used to identify complications such as inflammation (esophagitis), stricture, or Barrett’s esophagus. Endoscopy is an extremely safe procedure. A thin fiberoptic tube is used to examine the esophagus, stomach, and upper part of the small intestine. The individual is sedated so that the procedure can be performed comfortably. A painless biopsy (tissue sample) may be taken of the lower end of the esophagus to determine if Barrett’s esophagus is present.

**Esophageal manometry** measures pressure throughout the esophagus and in the area of the LES. A thin tube is inserted through the nose and into the esophagus. The test helps a physician determine whether the esophagus and LES are functioning properly.

**Esophageal pH monitoring** uses a thin tube inserted through the nose and into the esophagus, or a wireless pH capsule placed into the lower part of the esophagus during endoscopy. Both techniques sense and measure the amount of acid in the esophagus, over a 24-hour period for the probe and 48 hours for the capsule. Normal activities may be conducted while monitoring acid levels. Measurements can tell whether reflux is causing symptoms, how often reflux occurs, and how much acid is refluxed.

**Esophageal impedance + pH** uses a thin tube inserted through the nose and into the esophagus to sense and measure any type of reflux (acidic or non-acidic) that flows back into the esophagus. Measurements can tell whether acidic or non-acidic reflux is causing symptoms, how often reflux occurs, and how much is refluxed.

**IS GERD ASSOCIATED WITH CANCER OF THE ESOPHAGUS?**

In a small subset of patients with GERD, a complication has been identified as a potentially pre-cancerous condition. The condition is called Barrett’s esophagus. It occurs when a transformation takes place in the normal tissue lining of the esophagus and is a risk factor for the development of esophageal cancer. The number of people who develop Barrett’s esophagus is relatively small; approximately 10% of patients who have GERD will develop the condition, and only about 0.5% per year of those will develop esophageal cancer. Barrett’s esophagus is most common in people who have had heartburn for many years (more than 5–10 years), are over the age of 50, and are Caucasian males. If Barrett’s esophagus is present, regular endoscopic surveillance is advised.

Not everyone with frequent or severe heartburn will develop Barrett’s esophagus. For some reason, some people have heartburn and no esophageal damage, while other people have esophageal damage and no heartburn. Nevertheless, for those with chronic GERD or frequent symptoms, it is prudent to see a doctor for evaluation and consideration for an endoscopy to determine if Barrett’s esophagus is present.

In the absence of Barrett’s esophagus, there is not strong evidence that GERD is a risk factor for developing cancer. It is wise, however, to work with a doctor and be evaluated periodically to determine if the current course of treatment is optimal.
IS THERE A RELATIONSHIP BETWEEN GERD AND A GASTRIC INFECTION AS THERE IS FOR ULCERS?

Infection with *Helicobacter pylori* bacteria (*H. pylori*) is associated with peptic ulcer (an ulcer in the duodenum or the stomach). There is no strong evidence that *H. pylori* can cause GERD.

IS GERD CAUSED BY DIET AND WRONG FOODS?

Diet by itself does not cause GERD. Nevertheless, gastroesophageal reflux and its most frequent complaint of heartburn can be aggravated by foods. The foods that most often bother people are chocolate, onion, fried foods, fatty foods, peppermint, alcohol, caffeinated or carbonated beverages, and acidic foods. Spicy foods and citrus foods can worsen heartburn. Large fatty meals, because they slow the emptying of the stomach, and eating late at night can contribute to night-time heartburn. Alcohol can weaken the LES and make reflux worse.

CAN STRESS MAKE REFLUX WORSE?

More than 50% of patients complain that stress makes their heartburn worse. Studies using 24-hour pH monitoring show that the presence or absence of stress does not affect the total amount of actual reflux. However, stress has been shown to make the esophagus more sensitive to acid. The perception of frequency and severity of symptoms is amplified during stressful events. Stress management in these individuals appears to be beneficial.

WHAT IS THE TREATMENT FOR GERD?

GERD is a recurrent and chronic disease for which long-term medical therapy is generally effective. It is important to recognize that chronic reflux does not resolve itself. There is not yet a cure for GERD. Long-term and appropriate treatment is necessary.

The treatment of GERD is generally initiated by an individual when symptoms develop or when an individual with no apparent symptoms develops complications of GERD. The goals of treatment are: to bring the symptoms under control so that the individual feels better; heal the esophagus of inflammation or injury; manage or prevent complications such as stricture; and maintain the symptoms of GERD in remission so that daily life is unaffected or minimally affected by reflux. Treatment options include lifestyle modifications, medications, surgery, or a combination of methods.

*Lifestyle modifications:* Avoid factors that may aggravate symptoms, such as: reduce fats (they delay the emptying of gastric material and reduce LES pressure); reduce intake of caffeine, chocolate, onions, peppermint, and carbonated beverages (they decrease LES pressure); and eliminate or reduce intake of citrus and tomato products (acidic foods increase esophageal acid sensitivity). Increase protein intake (may accelerate gastric emptying). Alcohol intake and smoking adversely affect LES pressure and acid secretion. Do not lie down within 3–4 hours after eating (gastric distention stimulates LES relaxation). Avoid bending over or exercises that may increase intra-abdominal pressure. Elevating the head of the bed 6” may help to more rapidly clear
refluxed acid from the esophagus at night. Sleeping on one of your sides (usually the left) may help reduce the amount of reflux. Take actions to help get a good night’s sleep, like a calming activity before bedtime and going to bed at the same time each night.

Disclose the use of any medications to your physician. Certain medications can worsen symptoms. Some examples include: nonsteroidal anti-inflammatory drugs (used commonly to treat arthritis and general inflammation) can cause direct esophageal injury; sedatives and calcium channel blockers (used primarily to treat high blood pressure and angina) relax the LES; narcotics slow gastric emptying and worsen reflux; alendronate sodium (used to treat osteoporosis), unless taken exactly as directed and with lots of water, may damage the esophagus or increase reflux.

**Medications:** The classes of drugs prescribed to treat GERD are promotility agents, H2 blockers, and proton pump inhibitors. Promotility agents, such as metoclopramide (Reglan) primarily accelerate gastric emptying. Reglan should *not* be prescribed as the only treatment for GERD, but rather as an add-on to other anti-reflux medications in patients with gastroparesis. The drug may cause neurological side effects that may not go away after discontinuation.

**H2 blockers** (famotidine, cimetidine, ranitidine, nizatidine) reduce the amount of acid produced in the stomach. In prescription doses, they eliminate symptoms and allow esophageal healing in about 50% of patients. However, remission is maintained in only about 25% of people using H2 blockers.

Proton pump inhibitors limit acid secretion in the stomach. They allow rapid resolution of symptoms and healing of the esophagus in 80–90% of patients. The drug is also useful in managing stricture, one of the more serious complications of GERD. They are more effective than H2 blockers in inhibiting acid secretion.

There are several proton pump inhibitors available in the U.S. The FDA originally approved omeprazole (Prilosec) in 1989 and lansoprazole (Prevacid) in 1995, rabeprazole (Aciphex) in 1999, pantoprazole (Pantoloc/Protonix) in 2000, and esomeprazole (Nexium) in 2001. Zegerid is a combination of omeprazole and sodium bicarbonate. In 2009 dexlansoprazole (Kapidex) was introduced; in the U.S. it was renamed Dexilant in 2010.

**Surgery:** Surgical therapy may be indicated in the following circumstances:

- In patients who are not interested in long-term medical therapy
- In those whose symptoms cannot be controlled by medical management
- When symptoms recur
- If serious complications develop or recur

A thorough review of all aspects of the procedure with a gastroenterologist (a physician who specializes in these disorders) and a surgeon is advised.
HOW LONG IS IT NECESSARY TO TAKE MEDICATION TO CONTROL GERD?

GERD is a chronic disease, and most people require some form of regular, long-term therapy to keep their symptoms under effective control. This is similar to having high blood pressure or chronic headaches – clinical conditions that require regular medication. Even after symptoms are brought under control, the underlying disease remains present. It is possible that a person may need to take a medication for the rest of his or her life to manage GERD. This may change as new medications and procedures are developed.

ARE THERE CONCERNS ABOUT LONG-TERM USAGE OF MEDICATION TO TREAT GERD?

Any long-term use of medication should be under the direction and supervision of a physician. This includes both prescription and nonprescription drugs that are readily available over-the-counter. Side effects are rare; nonetheless, any drug can potentially have adverse effects.

The H2 blockers have been used since the mid-1970’s to treat reflux disease. Since 1995, they have been available in lower, nonprescription doses to treat occasional heartburn. The drugs have been shown to be safe, although adverse effects can occur such as headache and diarrhea.

The proton pump inhibitors omeprazole and lansoprazole have been used regularly in patients with GERD for many years. (Omeprazole has been available in the U.S. since 1989 and worldwide for several years beyond that.) Side effects from these agents are rare and principally include occasional diarrhea, headache, or stomach upset. These side effects are generally no more frequent than are seen with a placebo and usually occur when use of the drug course first begins. If none of these side effects have developed after several months or years of using a PPI, it is unlikely that any will develop later.

In patients with heart disease, who are taking clopidogrel bisulfate (Plavix), consumption of PPI’s such as omeprazole and esomeprazole should be avoided. Recent studies have suggested that in some individuals long-term treatment with PPI’s, especially in doses more than once a day, could result in osteoporosis, bone fracture, community acquired pneumonia, gastroenteritis, and hospital acquired colitis; talk to your doctor about this.

WHEN IS SURGERY AN ALTERNATIVE TO MEDICAL TREATMENT FOR GERD?

Medical therapy helps control symptoms as long as the medication is taken correctly. Surgery is an alternative that is generally applied when long-term medical treatment is either ineffective or undesirable, or when certain complications of GERD are present.

The most common surgical procedure for GERD is the Nissen fundoplication. It can be performed laparoscopically by an experienced surgeon. The goal of the surgery is to increase the pressure of the LES and prevent reflux. When performed by an experienced surgeon (at least 30–50 laparoscopic
operations) it may have a success rate approaching that of a well planned and carefully taken medical treatment with a proton pump inhibitor.

Side effects or complications associated with the surgery occur in 5–20% of patients. The most common is dysphagia, or difficulty swallowing. It is usually temporary and resolves after 3–6 months. Another problem that occurs in some patients is impairment of their ability to belch or vomit. This occurs because the surgical procedure forms a physical barrier to any type of back-flow of any gastric contents. A condition known as “gas-bloat” syndrome can occur; abdominal distention and discomfort results from not being able to belch effectively.

Anti-reflux surgery can break down, similar to hernia repairs in other parts of the body. The recurrence rate is not well defined but may be in the range of 10–30% over 20 years. Factors that can contribute to this breakdown include heavy lifting, strenuous athletic activity, marked changes in weight, and violent vomiting. Any of these factors have the potential to intermittently increase pressure that can cause a weakening or disruption of the surgery.

In some individuals, even after surgery, reflux symptoms may persist, and the use of medication may need to continue or resume.

It is important to recognize that GERD is a disease that should not be ignored or self-treated. Heartburn, the most frequent symptom, is so common that its significance may be underestimated. It is often casually dismissed and not associated with a disease, like GERD.

It is important to understand that GERD can have serious consequences for an individual. In addition to the physical complications that can arise, surveys report that uncomfortable or painful symptoms of acid reflux can intrude on all aspects of an individual’s daily life — emotionally, socially, and professionally.

In studies that measure emotional well-being, people with unresolved GERD often report worse scores than those with other chronic diseases, like diabetes, high blood pressure, peptic ulcer, or angina. Yet, nearly half of acid reflux sufferers do not recognize it as a disease.

GERD is a disease. It is not caused by lifestyle decisions. It is usually accompanied by obvious symptoms but may occur in the absence of obvious symptoms. If ignored or not appropriately treated, it can lead to more serious complications.

Most people with GERD have a mild form of the disease that can be controlled through lifestyle changes and medication. If you suspect you may have GERD, the first step is to consult a doctor to obtain an accurate diagnosis. Recognize that GERD is generally a treatable disease. Then work in partnership with your doctor to initiate the best available treatment plan for you.
The International Foundation for Functional Gastrointestinal Disorders (IFFGD) is a nonprofit education and research organization. Our mission is to inform, assist, and support people affected by gastrointestinal disorders such as GERD.

IFFGD produces publications with up-to-date information about digestive health, GERD, and other gastrointestinal disorders. The Foundation is supported by contributions. For more information, please contact:

The International Foundation for Functional Gastrointestinal Disorders (IFFGD) is a nonprofit education and research organization dedicated to informing, assisting and supporting people affected by gastrointestinal or motility disorders. The largest organization of its kind in the U.S., IFFGD has been working with patients, families, physicians, practitioners, researchers, employers, regulators and others to broaden understanding about gastrointestinal (GI) disorders. We work closely with health care professionals and the medical and pharmaceutical industries. This cooperative effort places IFFGD at the forefront of functional GI and motility disorders care and research, helping us to aid and benefit those affected.

We work with an international group of experts from multiple disciplines who serve on our medical advisory board. We provide a link between clinical research and patient care. Working together, we help ensure that clinical advancements concerning GI disorders result in improvements in the quality of life of those affected. IFFGD offers a community of support for people affected by functional GI and motility disorders. We are a resource for anyone seeking knowledge about these disorders.

We invite you to become a part of our worldwide community of support.

For People Affected by functional gastrointestinal and motility disorders, IFFGD offers a community of support. We . . .

- Print state-of-the-art information in our publications and quarterly journal, Digestive Health Matters, focusing on functional GI and motility disorders in adults and children
- Host a family of web sites that target the treatment and management of specific GI disorders
- Increase awareness of the medical and personal issues faced by those affected
- Fight for more research on methods to diagnose and treat these disorders
- Provide our members the means to voice their concerns where they count –
  - To the U.S. Congress which appropriates funding of research through the National Institutes of Health
  - To researchers in industries and institutions around the world
  - To clinicians who care for and treat patients

Working With Professionals in health care and industry, IFFGD forms alliances in support of treatment, scientific inquiry and clinical care. We . . .

- Initiate and sponsor educational symposiums
- Encourage the support of scientific inquiry and research through research awards
- Developed the IFFGD Functional GI Disorders Education Program Guide with leading experts in order to facilitate community education programs
- Provide a resource of information about the prevalence of functional GI disorders and the needs of people affected
- Participate in conferences and symposiums
- Provide patient support, assistance, and education
Gastrointestinal Disorders Addressed by IFFGD Include:

Abdominal Bloating or Pain
Chronic Constipation
Cyclic Vomiting Syndrome
Chronic Diarrhea
Chronic Intestinal Pseudo-obstruction (CIP)
Dyspepsia
Esophageal Disorders and Gastroesophageal Reflux Disease (GERD)
Gastroduodenal Disorders
Gastroparesis
Hirschsprung's Disease
Incontinence
Irritable Bowel Syndrome (IBS)
Pelvic Floor Pain

Gastrointestinal (GI) Disorders Affect Men, Women, and Children.

Did You Know…
- Irritable bowel syndrome (IBS) is one of the most common problems doctors see. It affects 15–20% of the general population and is a leading cause of absenteeism from work or school.
- In 1997 IFFGD first designated April as IBS Awareness Month. It is now listed on the U.S. National Health Observances calendar.
- Up to 60% of women with a history of problems during childbirth report incidents of bowel incontinence.
- In 1999 IFFGD sponsored the landmark meeting and first Consensus Conference on Treatment Options for Fecal Incontinence.
- It is estimated that 21 million Americans suffer from bouts of heartburn at least twice per week. Frequent heartburn is the most common symptom of GERD.
- In 1999 IFFGD first designated one week in November as GERD Awareness Week. It is now listed on the U.S. National Health Observances calendar.

Become a Member

Benefits of Membership
- Members are assured receipt of the latest information about research, care, and treatment published in our newsletter - Digestive Health Matters.
- Members become a part of a community of support with others who understand and share common concerns.
- Members are provided a means to voice their concerns where they count - to researchers in government and industry, and to clinicians who care for and treat patients.
- Members receive substantial discounts in our Library of information.
- Members are kept up-to-date about IFFGD events, awareness programs, clinical trials, and education programs.

To learn more about IFFGD member benefits or to join online, visit IFFGD.org

Yes, I wish to become a member of IFFGD. Enclosed is my tax-deductible donation.

Individual Yearly Membership

BECOME A MEMBER OF IFFGD

As a nonprofit organization, we rely on member donations to continue our education and research efforts.

Benefits of Membership

- Members can download fact sheets and brochures FREE from www.iffgd.org. Save 50% on hard copies mailed to you.
- Members receive the latest information about research, care, and treatment published in our journal — Digestive Health Matters.
- Members become a part of a community of support with others who understand and share common concerns.
- Members are provided a means to voice their concerns where they count — to researchers in government and industry, and to clinicians who care for and treat patients.
- Members are kept up-to-date about IFFGD events, awareness programs, clinical trials, and education programs.

Annual Individual Membership is $25.00 in the U.S. ($35.00 outside the U.S.). See page 15 of this booklet to join, or visit www.iffgd.org.

Visit the IFFGD Online Library

- View selected articles for free online
- See newly added publications
- Join IFFGD
- Renew your membership

**Fact sheets and brochures are $4 per copy ($2 per copy for IFFGD Members)**

164 **Using Relaxation in Coping with Gastrointestinal Disorders**
   Fact Sheet—By: Kenneth R. Jones, PhD; Steve Heymen, MS
   Topics: Brain-Gut, Complementary & Alternative Treatments, Irritable Bowel Syndrome (IBS), Stress

165 **Rectocele: Symptoms Include Vaginal Pain or Constipation**
   Fact Sheet—By: Bruce A. Orkin, MD, FACS, FASCRS
   Topics: Anal/Rectal Disorders, Constipation/difficult to pass stools, Lower Abdominal/Pelvic Pain, Pain Management, Pelvic floor disorders

166 **IBS in Men: A Different Disease?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Gender, Irritable Bowel Syndrome (IBS)

167 **Clostridium Difficile Infection**
   Fact Sheet—By: Charalabos Pothoulakis, MD
   Topics: Bacteria or gut flora, Diarrhea/loose stools, Other Disorders/Symptoms

168 **Current Pharmacologic Treatments of Irritable Bowel Syndrome**
   Brochure—By: Anthony J. Lembo, MD
   Topics: Irritable Bowel Syndrome (IBS)

169 **Diverticula, Diverticulosis, Diverticulitis: What’s the Difference?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Diverticular disease

170 **What is Constipation Anyway?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Constipation/difficult to pass stools

171 **Hypnosis Treatment of Irritable Bowel Syndrome**
   Fact Sheet—By: Olafur S. Palsson, PsyD
   Topics: Brain-Gut, Complementary & Alternative Treatments, Irritable Bowel Syndrome (IBS)

172 **What are Placebos? Are they good for you?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Working with your healthcare provider

175 **Diagnostic Tests in Irritable Bowel Syndrome Patients**
   Fact Sheet—By: Brooks D. Cash, MD; William D. Chey, MD
   Topics: Irritable Bowel Syndrome (IBS), Tests for lower GI tract

176 **Nuts, Seeds, and Diverticula**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Diverticular disease

177 **Report on the 5th International Symposium on Functional Gastrointestinal Disorders**
   Fact Sheet—By: Douglas A. Drossman, MD; William F. Norton, Publications Editor, IFFGD
   Topics: IFFGD/General Interest

178 **Sleep and Irritable Bowel Syndrome**
   Fact Sheet—By: William C. Orr, PhD
   Topics: Irritable Bowel Syndrome (IBS)

179 **Difficult to Interpret Intestinal Complaints**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Bowel urgency or incontinence, Constipation/difficult to pass stools, Diarrhea/loose stools, Gas/Bloating/Belching, Rectal Pain/Disorders

181 **Complementary and Alternative Treatments for Functional Gastrointestinal Disorders**
   Fact Sheet—By: Kirsten Tillisch, MD; Steven Tan, MD, MTOM, LAc
   Topics: Complementary & Alternative Treatments, Diet/Foods, Dyspepsia/pain in upper abdomen or chest, Irritable Bowel Syndrome (IBS), Biofeedback

182 **Why Symptom Criteria for Functional Gut Disorders?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Anal/Rectal Disorders, Bowel urgency or incontinence, Dyspepsia/pain in upper abdomen or chest, Esophageal Disorders, Irritable Bowel Syndrome (IBS), Lower Abdominal/Pelvic Pain

183 **Pregnancy and Irritable Bowel Syndrome**
   Fact Sheet—By: Margaret M. Heitkemper, RN, PhD
   Topics: Gender, Irritable Bowel Syndrome (IBS)

184 **Irritable Bowel Syndrome**
   Fact Sheet—By: Lin Chang, MD
   Topics: Brain-Gut, Gender, Inflammation, Irritable Bowel Syndrome (IBS)

185 **Talking to Your Doctor About Irritable Bowel Syndrome**
   Fact Sheet—By: International Foundation for Functional Gastrointestinal Disorders (IFFGD)
   Topics: Irritable Bowel Syndrome (IBS), Working with your healthcare provider

186 **Hypnotherapy for Functional Gastrointestinal Disorders**
   Fact Sheet—By: Peter J. Whorwell, BSc, MD, PhD
   Topics: Brain-Gut, Complementary & Alternative Treatments, Dyspepsia/pain in upper abdomen or chest, Irritable Bowel Syndrome (IBS)

187 **What is Pelvic Pain?**
   Fact Sheet—By: W. Grant Thompson, MD, FRCP(C)
   Topics: Lower Abdominal/Pelvic Pain

Topics: Bowel Urgency, Incontinence

304 The Etiology of Fecal Incontinence: Causes and Diagnosis
Fact Sheet–By: Robert D. Madoff, MD, FACS
Topics: Bowel urgency, incontinence

306 Medical Management of Fecal Incontinence
Fact Sheet–By: Ann C. Lowry, MD, FACS
Topics: Bowel Urgency, Incontinence

307 Research Priorities for Fecal Incontinence: The Patient's Perspective
Fact Sheet–By: Nancy J. Norton, President, IFFGD
Topics: Bowel Urgency, Incontinence, General Interest

308 Colorectal Cancer and Continence
Brochure–By: Joshua A. Katz, MD; Bruce A. Orkin, MD, FACS, FASCRS
Topics: Bowel Urgency, Incontinence, Colon Cancer, Rectal Cancer, Ileostomy, Effects of Radiation

309 Changes in Pelvic Floor Function at Childbirth and After Delivery
Fact Sheet–By: Anne M. Weber, MD, MS
Topics: Anal/Rectal Disorders, Bowel urgency or incontinence, Pelvic floor disorders

311 Biofeedback, Incontinence, and the Patient's Perspective
Fact Sheet–By: Nancy J. Norton, President, IFFGD
Topics: Bowel urgency or incontinence, Complementary & Alternative Treatments, Pelvic floor disorders

312 Report from IFFGD Research Award Winner: Mechanisms of Fecal Incontinence
Fact Sheet–By: Adil E. Bharucha, MD
Topics: Anal/Rectal Disorders, Bowel urgency or incontinence, Pelvic floor disorders

313 Bowel Incontinence and Aging
Brochure–By: William F. Norton, Publications Editor, IFFGD
Topics: Bowel Urgency, Incontinence, Constipation, Diarrhea, Irritable Bowel Syndrome (IBS), Pelvic Floor Disorders, Biofeedback

314 Changes in Bowel Control at Childbirth
Brochure–By: William F. Norton, Publications Editor, IFFGD
Topics: Bowel urgency or incontinence, Incontinence, Pelvic floor disorders

315 Report from IFFGD Research Award Winner: Chronic Pelvic Pain and the Overlap of Chronic Pelvic Pain Disorders
Fact Sheet–By: Michael Pezzzone, MD, PhD
Topics: Irritable Bowel Syndrome (IBS), Lower Abdominal/Pelvic Pain, Pain Management, Pelvic floor disorders, Rectal Pain/Disorders

316 Talking To Your Doctor About Incontinence
Fact Sheet–By: William F. Norton, Publications Editor, IFFGD
Topics: Incontinence, Diarrhea, Constipation

317 Radiation Induced Injury to the Colon and Rectum
Fact Sheet–By: Thomas Puetz, MD
Topics: Incontinence, Radiation Injury

318 Biofeedback, Incontinencia, y la Perspectiva del Paciente (Spanish version of Fact Sheet 311)
Fact Sheet–By: Nancy J. Norton, President, IFFGD
Topics: Bowel urgency or incontinence, Complementary & Alternative Treatments, Pelvic floor disorders

Fact sheets and brochures are $4 per copy ($2 per copy for IFFGD Members)

827 **Functional Recurrent Abdominal Pain in Children and Adolescents**  
    Fact Sheet—By: John V. Campo, MD  
    Topics: Dyspepsia/Pain in Upper Abdomen or Chest, Irritable Bowel Syndrome (IBS), Lower Abdominal/Pelvic Pain, Pain Management

828 **Know Thy Laxatives: A Parent’s Guide to the Successful Management of Chronic Functional Constipation in Infants and Children**  
    Fact Sheet—By: Joseph Levy, MD; Diana Volpert, MD  
    Topics: Constipation/Difficulty to Pass Stools

829 **Defecation Disorders after Surgery for Hirschsprung’s Disease**  
    Fact Sheet—By: Paul E. Hyman, MD  
    Topics: Anorectal Disorders, Constipation/Difficulty to Pass Stools, Fecal Soiling/Incontinence, Hirschsprung’s Disease

830 **Report from IFFGD Research Award Winner: Biopsychosocial Perspectives on Assessment and Treatment**  
    Fact Sheet—By: Caroline Elder Danda, PhD  
    Topics: Constipation/Difficulty to Pass Stools, Fecal Soiling/Incontinence, Lower Abdominal/Pelvic Pain, Pain Management

831 **Constipation in Young Children**  
    Fact Sheet—By: Paul E. Hyman, MD  
    Topics: Constipation/Difficulty to Pass Stools, Other Disorders/Symptoms

832 **Report from IFFGD Research Award Winner: Using the Fetal Gastrointestinal Tract to Overcome Neonatal Disease**  
    Fact Sheet—By: Terry L. Buchmiller-Crair, MD  
    Topics: Fetal Gastrointestinal Development

833 **Report from IFFGD Research Award Winner: Research into Treatment – Resistant Constipation in Children**  
    Fact Sheet—By: Bridgett R. Southwell, PhD  
    Topics: Constipation/difficulty to pass stools

834 **Report from IFFGD Research Award Winner: Symptoms Arising from Non-Acid Reflux in Children**  
    Fact Sheet—By: Rachel Rosen, MD, MPH  
    Topics: GER/GERD, Tests for upper GI tract

835 **Report from IFFGD Research Award Winner: Home Based Guided Imagery to Treat Pediatric Functional Abdominal Pain**  
    Fact Sheet—By: Miranda A. L. van Tilburg  
    Topics: Dyspepsia, Pain in Upper Abdomen or Chest, Functional, Lower Abdominal Pain, Pelvic Pain, Pain Management

836 **Helping Children And Adolescents Cope with Abdominal Pain**  
    Fact Sheet—By: Lynn Walker, PhD  
    Topics: Abdominal Pain, Pain Management

837 **Hirschsprung’s Disease in Children and Adults**  
    Fact Sheet—By: Samuel Nurko, MD, MPH  
    Topics: Hirschsprung’s Disease, Constipation, Obstruction, Incontinence, Enterocolitis

838 **Soiling Solutions®: An Internet and Manual Based Approach to Treating Encopresis**  
    Fact Sheet—By: Robert W. Collins, PhD, PC; Editorial Comment By: Paul E. Hyman, MD  
    Topics: Encopresis, Relaxation Training

839 **Chronic Intestinal Pseudo-Obstruction**  
    Fact Sheet—By: William F. Norton, Reviewed by Carlo Di Lorenzo, MD  
    Topics: CIP, Symptoms, Diagnosis, Treatment, Nutrition

840 **Functiona Abdominal Pain in Children and Adolescents**  
    Fact Sheet—By: Migeul Saps, MD  
    Topics: Functional Abdominal Pain, Symptoms, Diagnosis, Treatment

BECOME A MEMBER OF IFFGD

As a nonprofit organization, we rely on member donations to continue our education and research efforts.

Benefits of Membership

- Members can download fact sheets and brochures FREE from www.iffgd.org. Save 50% on hard copies mailed to you.
- Members receive the latest information about research, care, and treatment published in our journal — Digestive Health Matters.
- Members become a part of a community of support with others who understand and share common concerns.
- Members are provided a means to voice their concerns where they count — to researchers in government and industry, and to clinicians who care for and treat patients.
- Members are kept up-to-date about IFFGD events, awareness programs, clinical trials, and education programs.

Annual Individual Membership is $25.00 in the U.S. ($35.00 outside the U.S.). See page 15 of this booklet to join or visit www.iffgd.org.
